How much energy is stored in a small air gap?

The small air-gap might be (say) 1mm long and, have an effective volume of 0.02 milli cubic metres. That's a volume ratio of 100:1 (not surprisingly) but, the core might have a relative permeability that is 1000 times that of air hence, 10 times more energy is stored in the air gap. Nice explanation ! :D

What is the future market potential for compressed air energy storage systems?

The future market potential for compressed air energy storage (CAES) systems is substantial.

What is the adiabatic configuration of a compressed air energy storage system?

The adiabatic configuration of CAES has been under development since the late 1970s, aiming to address the limitations of diabatic CAES. This particular compressed air energy storage system focuses on effectively capturing and storing the waste heat generated during compression.

Why do we have more energy in the air gap?

What I know is that the reluctance across the air gap is higher than the reluctance across the core. So if the flux density is constant into the air gap or into the core, we have indeed more energy contained into the air gap because H^2 is higher.
