What is chemical energy storage?

**DEFINITION:** Energy stored in the form of chemical fuels that can be readily converted to mechanical, thermal or electrical energy for industrial and grid applications. Power generation systems can leverage chemical energy storage for enhanced flexibility.

How do thermochemical energy storage systems work?

Thermochemical energy storage systems utilize chemical reactions that require or release thermal energy. They have three operating stages: endothermic dissociation, storage of reaction products, and exothermic reaction of the dissociated products (Fig. 7). The final step recreates the initial materials, allowing the process to be repeated.

What are the different types of chemical energy storage systems?

Some of the chemical storage systems which are not yet commercialised can also be listed, such as hydrated salts, hydrogen peroxide and vanadium pentoxide. It is vital to note that chemical energy storage also includes both electrochemical energy storage systems and the thermochemical energy storage systems.

Which type of energy storage is compatible with electrochemical storage?

Storing electrical energy in chemical form, via electrolysis in the case of hydrogen, is compatible with the electrochemical storage since chemical fuels have higher energy densities. Hydrogen is not a direct energy source; instead, it is an intermediate energy form and is an ideal candidate as an energy carrier or storage medium.

What are chemical and thermochemical energy storage technologies?

In addition to the conventional chemical fuels, new chemical and thermochemical energy storage technologies include sorption and thermochemical reactions such as ammonia system. The main purpose of large chemical energy storage system is to use excess electricity and heat to produce energy carrier, either as pure hydrogen or as SNG.

Which energy storage methods are based on the type of intermediate energy?

Figure 2.3 shows energy storage methods based on the type of intermediate energy form. The thermochemical ES is intentionally highlighted under thermal energy storage since the thermochemical ES is considered as a chemical ES method in some classifications that are provided in the literature.

In addition to covalently bound hydrogen as solids, compounds that are capable of binding hydrogen as liquids have been studied. Examples of systems based on liquid carriers include n-ethylcarbazole 4 and methyl-cyclopentane 5 as shown ...
